

# Can Deep Learning help us to unveil LAEs through broadband filters?

BRUNO CERQUEIRA

This work was supported by Fundação para a Ciência e a Tecnologia (FCT) through the research grants UIDB/04434/2020 and UIDP/04434/2020, and in the form of an exploratory project with the EXPL/FIS-AST/1085/2021 reference (PI: Paulino-Afonso).

# DATA

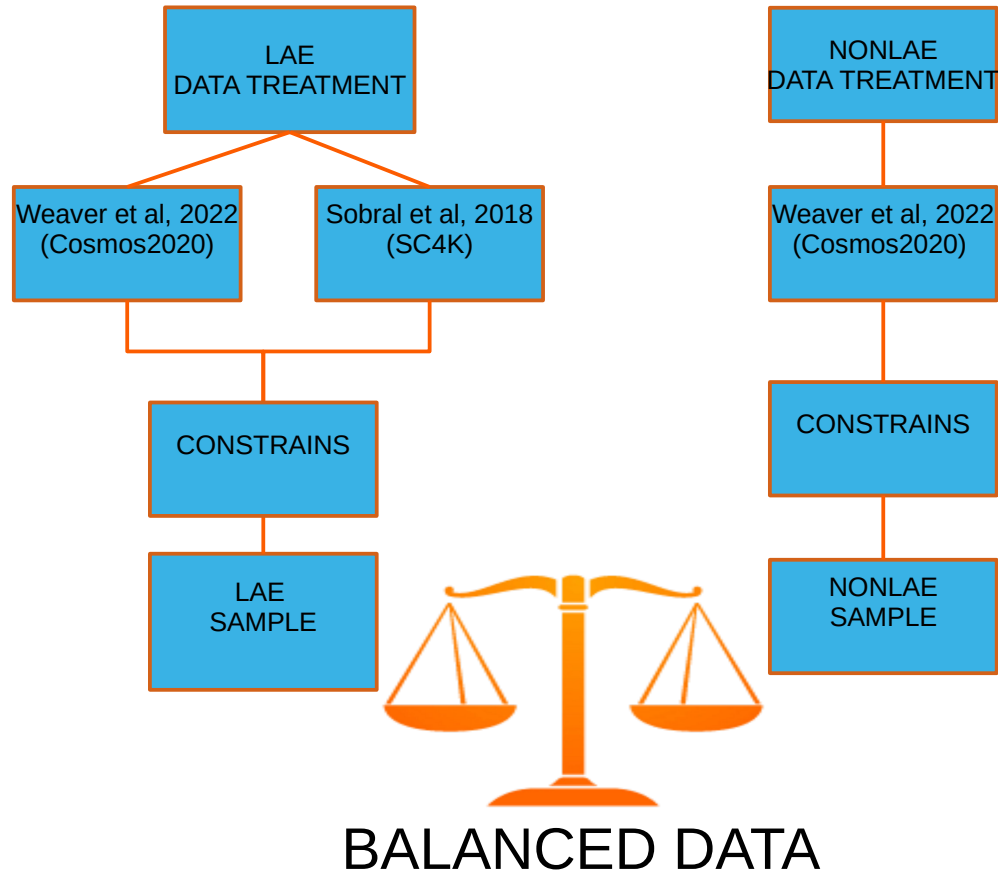

## ONO ET AL, 2021

- Redshift: 2.2-7.0
- 8 CLASSES
- 6 NarrowBands + 5 BroadBands
- Motivation: identify LAEs in the middle of everything, noise, artifacts

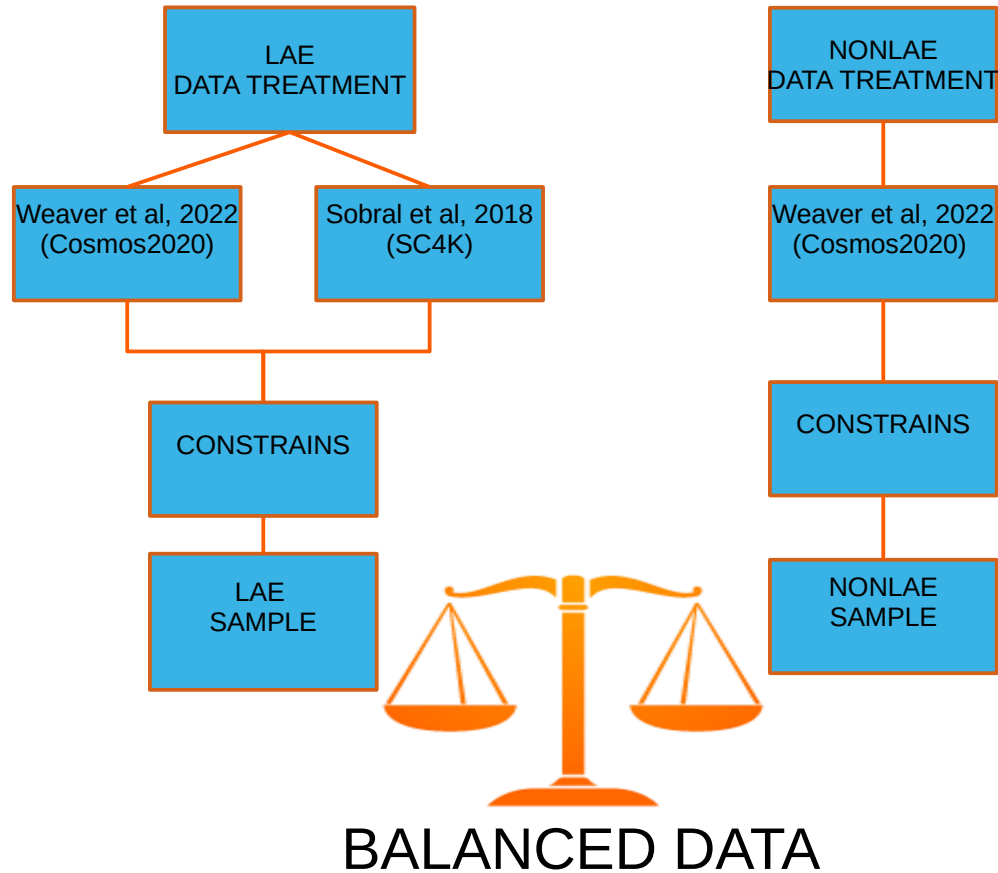

## FLAEMING – Deep Learning

- Redshift: 2.0-6.0
- 2 CLASSES (LAE - NONLAE)
- BroadBands 3 or 4\*
- Motivation: Distinguish LAES from other galaxies

# DATA

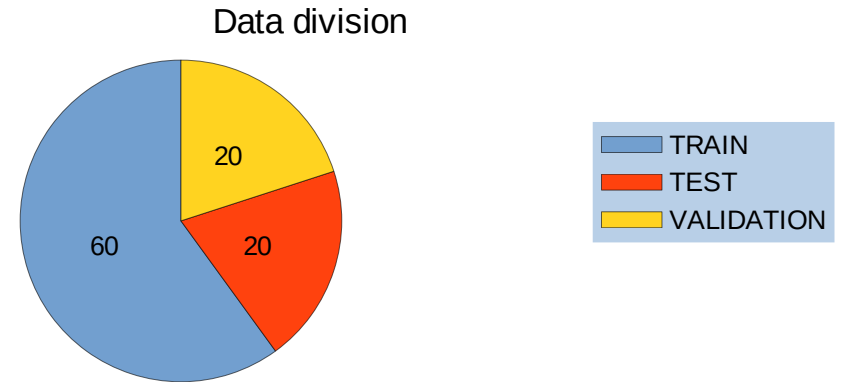

# DATA

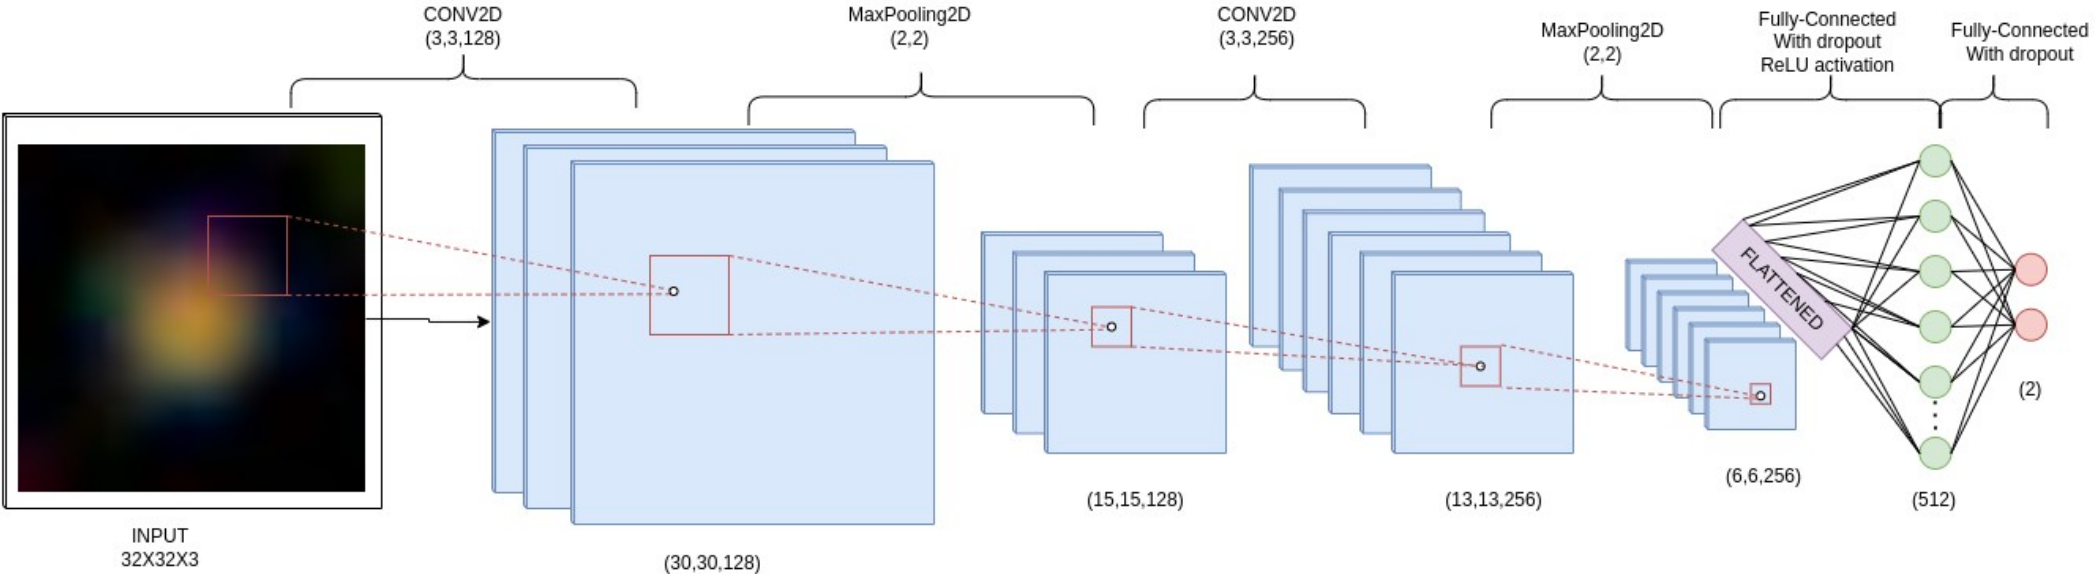

- **CONSTRAINS**
  - Redshift 2-6 for both datasets
  - ip\_Mag 22-40 for SC4K
  - ip\_Mag 0-40 for cosmos
  - Remove LAE SAMPLE from cosmos
  - Mimic the redshift and ip\_mag from LAE to NONLAE

# DATA

# CNN STRUCTURE

Duration: ~10 min

CONV2d

CONV2d\_1

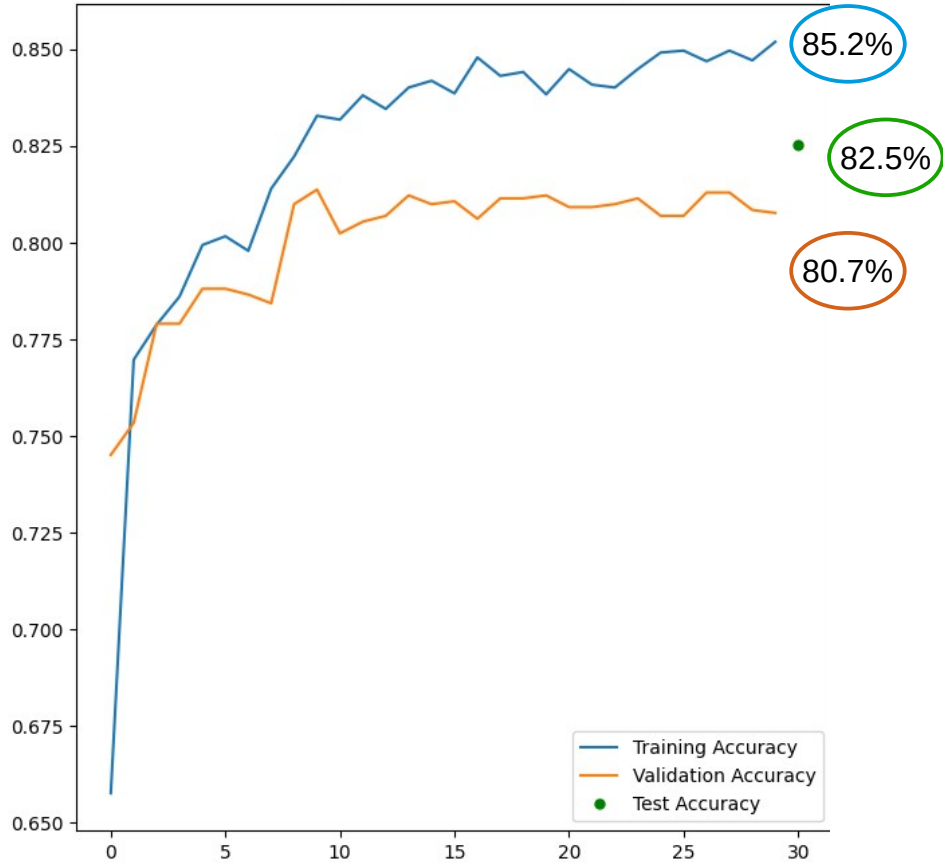

Total params:  $((3 \times 3 \times 3) + 1) \times 128 + ((3 \times 3 \times 128) + 1) \times 256 + (512 \times 9216) + 1 \times 512 + ((2 \times 512) + 1) \times 2 = 5,018,882$  Parameters

# Results – RGB

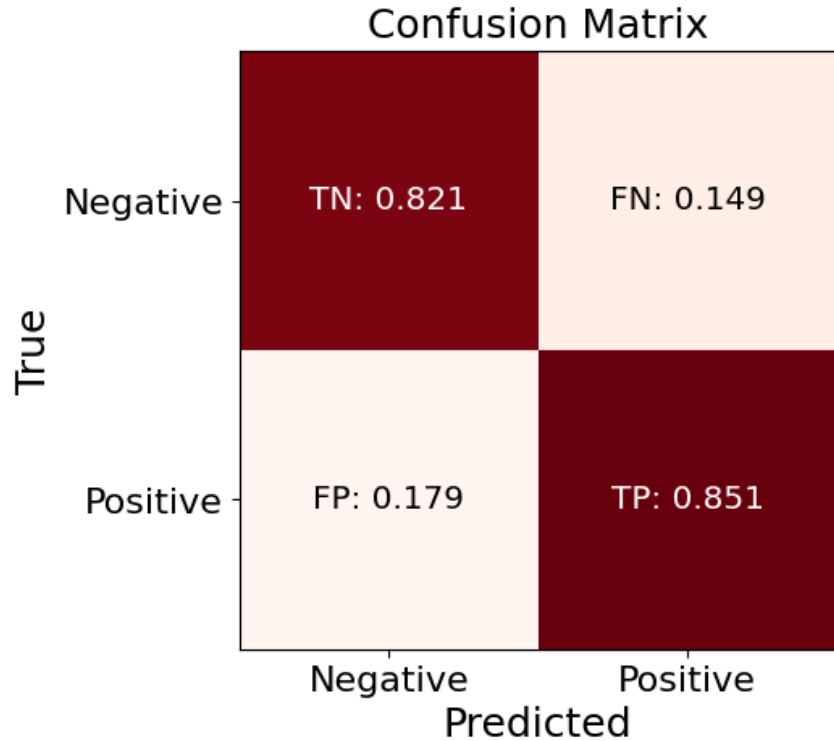

Training and Validation Accuracy

Training and Validation Loss

# MODEL EVALUATION

- Evaluate the performance of a classification
  - TN= true negative
  - FN= false negative
  - FP= false positive
  - TP= True positive

# MODEL EVALUATION

- ROC curve: Receiver operating characteristic curve
- Shows the performance of a classification

# Predictions over test

LAE 99% (LAE)

LAE 99% (LAE)

NONLAE 97% (NONLAE)

NONLAE 97% (NONLAE)

Accuracy:82.5%

LAE 70% (NONLAE)

LAE 70% (NONLAE)

NONLAE 59% (LAE)

NONLAE 59% (LAE)

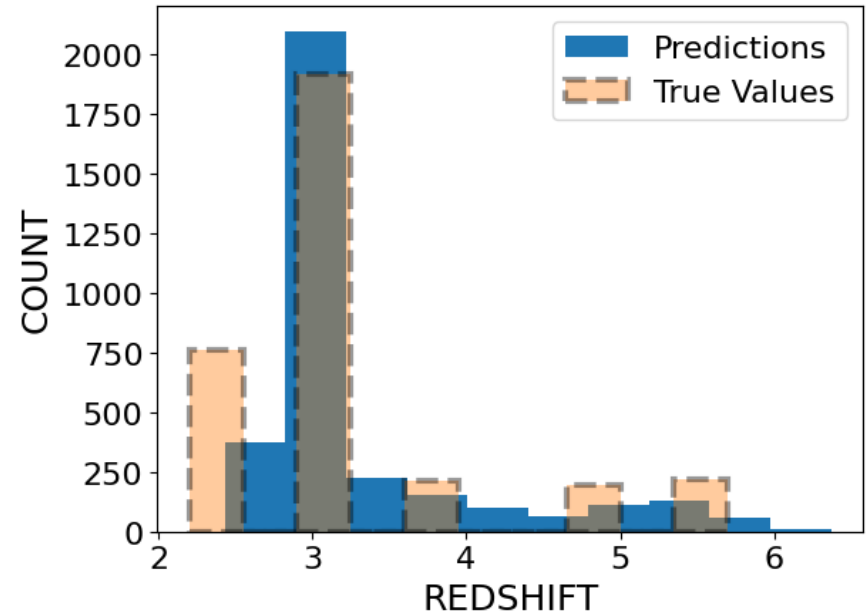

# Predictions over all sources

- Over all Cosmos 2020, our model predict 53958 possible LAEs
- Among them
  - Comparing to HETDEX has 25 True Positive matches
  - Comparing to DEIMOS has 84 True Positive matches

# REGRESSION

- Change the CNN structure to fit regression, - in classification we want the output to be one of the wanted class, while in regression we want a single value.
- Also despite the CNN structure Classification model was functional in our data, that does not mean the same CNN structure would work for the regression

# REGRESSION

- Predictions for redshift using only rgb input
- Applied over the LAEs Sample

# SUMMARY

- Classification: Create two samples one for LAE the other NONLAE, use subaru matched\_psf to generate rgb with gp,rp,ip, divide them by 60 train 20 test 20 validation, the input are only images, train the model, make predictions over test set and later over the not used NONLAE.
- Regression: Same steps for rgb generation, and data division, change the CNN structure to fit a regression, and the data input should have the rgb images and the true labels, after train, make predicition over test sample and compare the true label with predict label.
- 53958 Possible LAEs among them 25 true positives matches with HETDEX and 84 matches with DEIMOS

# TAKE HOME MESSAGE

- Yes it is possible to identify LAE with only broadbands, it is open to improvements such as:
  - Parameters fine tuning
  - Combination with predictions over 1d data (e.g. UV morphology, Paulino-Afonso et al, 2018)
- We aim to generalize to other extragalactic fields and surveys.
- THANK YOU!!
